

Revenue Simulation Model

Excel-based sales funnel extension for revenue forecasting and scenario planning

Company	Project Type	Primary Tool	Output Format
Amp	Business simulation	Microsoft Excel	Excel

1. Project Overview

This project extended an existing sales funnel report into a revenue simulation model. The original report helped the sales team monitor appointment pipeline, previous appointments, real attended appointments, customer trials, and final sales. However, revenue forecasting and scenario simulation were not connected to the funnel data, and region/area-level funnel visibility was limited. I built additional Excel sheets to convert operational funnel movement into revenue, capacity, and workforce planning insights.

Confidentiality note

Screenshots in this document are generated samples with blurred and fictional data. They demonstrate the workbook structure without exposing real sales, customer, pricing, or revenue information.

2. Problem Statement

Revenue calculation was separate from the sales funnel. Sales teams used funnel data to understand how potential customers moved from first interest to purchase and where they dropped off. The report supported bottleneck analysis, conversion improvement, and sales team performance tracking. For supply chain and inventory planning, I needed region and area-level funnel visibility to understand customer and sales patterns. The missing revenue forecast layer made it difficult to translate funnel movements into expected business impact.

3. Objectives

- Create a structured revenue forecast directly from appointment, trial, sales, and revenue data.
- Segment funnel performance by region and area to support inventory and demand planning decisions.
- Simulate how business initiatives could affect future revenue, sales capacity, and workforce needs.
- Provide a practical Excel-based output that could be used by sales and planning stakeholders without exposing complex backend logic.

4. My Contribution and Team Contribution

My contribution	Sales team contribution
Identified the gap between funnel monitoring and revenue forecasting; designed the funnel segmentation logic; built the Revenue Model and Business Simulation sheets; calculated conversion rates and revenue drivers; created scenario levers for initiatives such as campaigns, reminder programs, sales training, pricing changes, and staffing capacity.	Owned the original sales funnel report; provided business context for appointment, trial, sales, and revenue definitions; reviewed assumptions and helped validate whether simulated outcomes were meaningful for sales and operational planning discussions.

Data area	Example fields	Purpose in model	Owner / Source
Appointment pipeline	Month, region, area, planned appointments, previous appointments	Measures top-of-funnel demand and future sales opportunity	Existing sales funnel report
Actual attendance	Real attended appointments, no-shows, attendance rate	Identifies drop-off before customer trial stage	Existing sales funnel report
Trial and sales	Customer trials, final sales, conversion rates	Calculates trial-to-sale and funnel effectiveness	Existing sales funnel report
Revenue data	Sales value, average revenue per sale, pricing assumptions	Converts funnel volume into expected revenue	Sales / Finance input
New simulation sheets	Scenario levers, uplift assumptions, forecast revenue, capacity gap	Supports what-if analysis and business planning	Built as part of this project

6. Methodology

- Portfolio document - no confidential data, formulas, or internal workbook logic disclosed

7. New Sheet 1 - Funnel Segment

Purpose: The Funnel Segment sheet translated the sales funnel into region and area-level performance views. This helped identify where customers dropped off, whether due to attendance issues, low trial activation, sales conversion gaps, or capacity constraints. For inventory planning, this view made it easier to connect demand signals with regional sales behavior.

Figure 2. Sample Funnel Segment sheet showing regional funnel KPIs and bottleneck categories

Metric	Calculation logic	Business interpretation
Attendance rate	Attended appointments / appointment pipeline	Measures the ability to convert scheduled demand into real customer interactions.
Trial conversion rate	Customer trials / attended appointments	Highlights whether attended appointments are becoming product trials.
Sales conversion rate	Final sales / customer trials	Shows effectiveness of converting trials into revenue-generating sales.
Average revenue per sale	Revenue / final sales	Connects funnel volume to commercial value.

8. New Sheet 2 - Revenue Model

Purpose: The Revenue Model sheet connected conversion rates with expected sales and average revenue per sale. This allowed the funnel report to move beyond activity tracking and support revenue forecasting. The model used business-friendly logic so that stakeholders could understand how changes in each funnel stage affected expected revenue.

[illegible]

Figure 3. Sample Revenue Model sheet with conversion-based revenue forecast logic

Simplified revenue logic

Expected Revenue = Appointments x Attendance Rate x Trial Conversion Rate x Sales Conversion Rate x Average Revenue per Sale. This formula is presented as a simplified portfolio case-study explanation; the real workbook structure and internal logic are not disclosed.

9. New Sheet 3 - Business Simulation

Purpose: The Business Simulation sheet converted funnel and revenue logic into a what-if planning tool. It allowed stakeholders to test initiatives such as marketing campaigns, customer reminder programs, trial activation improvements, pricing changes, sales training, and additional staffing. The output helped frame discussions around revenue growth, operational capacity, and workforce requirements.

Figure 4. Sample Business Simulation sheet for scenario planning and revenue impact analysis

Scenario lever	Example impact path	Planning question answered	Output indicator
Marketing campaign	More appointments enter the funnel	How much extra revenue could a campaign generate?	Projected appointments and revenue delta
Reminder program	Higher attendance rate	Can no-shows be reduced enough to improve sales?	Attendance uplift and revenue uplift
Trial activation	More attended appointments move to trials	Where should the team focus to improve conversion?	Trial conversion and expected sales
Sales training	Higher trial-to-sale conversion	What is the revenue effect of improved closing?	Sales conversion and revenue delta
Additional staffing	More capacity to handle demand	Is workforce capacity a constraint?	Capacity risk and required support

10. Business Impact

- Made revenue forecasting easier by linking funnel activity to expected commercial outcomes.
- Improved visibility at region and area level for sales, inventory, and demand-planning discussions.
- Helped the sales team evaluate business initiatives before implementation through scenario simulation.
- Supported capacity and workforce conversations by showing how funnel changes could affect demand and revenue.
- Converted a reporting workbook into a decision-support model without requiring the original sales funnel report to be redesigned.

Skills demonstrated	What is intentionally not shared
Excel modelling, business simulation, funnel analysis, KPI design, revenue forecasting, scenario planning, stakeholder collaboration, sales and supply chain analytics.	Real workbook, customer data, region/area performance, pricing, revenue numbers, formulas, and confidential business logic.

Repository note: This document is designed for a GitHub portfolio to explain the project approach and business value without sharing internal files or sensitive information.
